

Pre – AP Biology

Process of Meiosis (5.4)

Somatic vs. Germ

Female XX Karyotype

(Remember... “kary” means “nucleus”)

Human Female
G-bands

Male XY Karyotype

Human male
G-bands

Germ cells

TWO Divisions of Meiosis

Meiosis I - **First** Division

MEIOSIS I:
Separates homologous chromosomes

INTERPHASE

PROPHASE I

METAPHASE I

ANAPHASE I

Meiosis II - **Second** Division

MEIOSIS II:
Separates sister chromatids

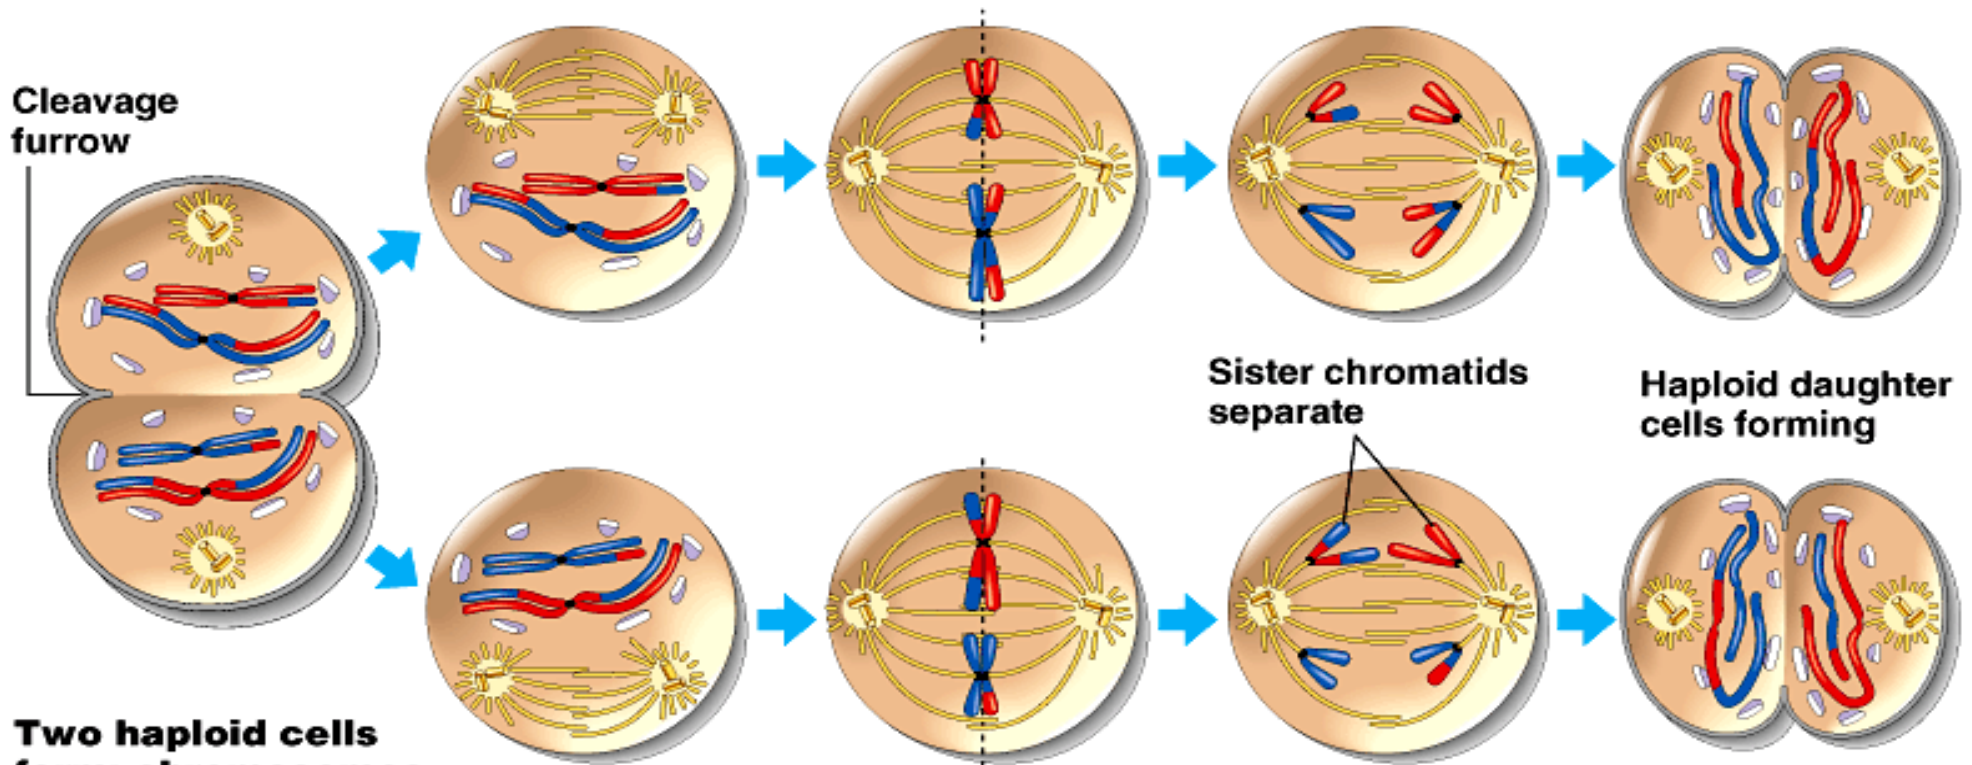

**TELOPHASE I
AND CYTOKINESIS**

PROPHASE II

METAPHASE II

ANAPHASE II

**TELOPHASE II
AND CYTOKINESIS**

**Two haploid cells
form; chromosomes
are still double**

**During another round of cell division, the sister chromatids finally
separate; four haploid daughter cells result, containing single
chromosomes**

Spermatogenesis

Oogenesis in the ovaries

Variation is the outcome desired

Mitosis vs. Meiosis

SUMMARY		
Event	Mitosis	Meiosis
DNA replication	Occurs during interphase before nuclear division begins	Occurs once, during the interphase before meiosis I begins
Number of divisions	One, including prophase, metaphase, anaphase, and telophase	Two, each including prophase, metaphase, anaphase, and telophase
Synapsis of homologous chromosomes	Does not occur	Synapsis is unique to meiosis: During prophase I, the homologous chromosomes join along their length, forming tetrads (groups of four chromatids); synapsis is associated with crossing over between nonsister chromatids
Number of daughter cells and genetic composition	Two, each diploid ($2n$) and genetically identical to the parent cell	Four, each haploid (n), containing half as many chromosomes as the parent cell; genetically nonidentical to the parent cell and to each other
Role in the animal body	Enables multicellular adult to arise from zygote; produces cells for growth and tissue repair	Produces gametes; reduces chromosome number by half and introduces genetic variability among the gametes
